## Rheumatism:

Cullen has defined rheumatism according to the following translation - A disease from an external and often an violent cause, pyrexia, pain about the joints following the course of the muscles, fixing upon the large joints in preference to the smaller, increased by rational heat. He next divides it into two kinds, the acute and Chronic; the former he distinguishes by the form, and the latter by the duration in the text.

The acute form (The only form I shall notice), is ushered in with the usual symptoms of pyrexia: with lassitude and <sup>some</sup> rigour, succeeded by heat, thirst, anxiety and restlessness. The pulse is hard, full and quick; the blood drawn from a vein exhibits an inflammatory crust upon cooling. These are soon succeeded by

any excruciating pains in different parts of  
the body, but worse in the joints than in  
the limbs. On the approach of coming time  
an excitation of the fever, and during  
the night the pains become very severe,  
and is generally increased by the slightest  
motion or pressure. The stomach in  
the disease is rarely much affected, but the  
bowels are generally costive. In the early stage  
of the complaint, some degree of sweating  
takes place; but without determining to a crisis.  
The urine is scanty and deep coloured, and  
cloudy without a distinct sediment at first; but  
when the fever has advanced and violent con-  
vulsions and remittent hectic fever, a toler-  
able sediment is deposited.

Diagnosis. Gout and rheumatism are so closely  
allied, in their more perfect forms, that they  
are very liable to be confounded. And in many

take, we have  
 not been  
 of, and can

stances, we have to distinguish them rather by the collateral circumstances of temperament, period of life, antecedent affections of the digestive organs, than from the appearance of the actual symptoms themselves. The best diagnoses are, that rheumatism arises from some violent cause, Gout not so. The latter is always ushered in with gastric distress. The attack of rheumatism is not so sudden as a fit of gout, and does not often attack the small joints, but confines itself chiefly to the large joints. The fever is more continued in rheumatism, than in gout. So closely allied are these two diseases, that they were considered identical, until distinguished by Boissonius in section hundred and forty-two, in his treatise "De Rheumatismo et Pleuritide Vesicali".

Predisposing Causes. The early <sup>of young</sup> years are a great measure exempt from rheumatism.

tion, though persons of all ages become sometimes affected. It most frequently attacks persons from ten to fifty years of age. After the age of fifty, it more commonly appears in the chronic form.

Motions caused induce debility, either general or partial, in the tendons, ligaments &c become predisposing causes to the acute or chronic rheumatism. Gender sex is indiscriminably liable to have an attack of rheumatism, but the male sex appears to constitute the largest portion.

The season of the year is a predisposing cause, in proportion to the degree of moisture and variable temperature prevailing. It appears much more frequently in the spring and autumn than at any other seasons.

Excessive perspiration, however profuse, disposing the body to the injurious influence, of exposure to a damp and cold atmosphere, is a very active predisposing cause.

resting Bodies. The above may be brought into  
action by the influence of a variable temperature,  
the generally or partially applied, or either the  
up the medium of a wet. of cold air  
alone or both together. Sleeping with one, such  
room, while the other is exposed to moisture  
cold air; hence the more frequent occurrence  
among the laboring and indigent part of the  
community.

Pathology. <sup>of the</sup> views entertained of the Pathology  
& Rheumatism, are <sup>that it is</sup> a facular inflammatory aff  
ection of the fibrous tissue - differing in some res-  
pects from <sup>the</sup> common cases of phlegmasia, both in  
progress and termination. As a general rule it may  
be asserted that Rheumatism does not lead to  
suppuration. In a few rare instances the contrary  
has been stated to have taken place, but they are  
so rare as not to call for the general rule. It  
assumes a variety of forms, attacking for the most

to larger joints. Sometimes it is decided in other parts, as the brain, head and in some cases even in the superficies of the body. Rheumatism sometimes becomes retrocedent, falling on the lymphatic canal and other internal vessels, when in a debilitated state.

Prognosis. It is general, but not an unnatural defense, purgation; the deposit of a salutary sediment in the urine, eruptions on the skin, a moderate hemorrhage of blood from the nose, or from other parts, ~~and that~~ may be looked upon as favourable symptoms. In the other and when the inflammation becomes cordipalvous and assumes a dark red colour, and this followed by <sup>thrombosis</sup> metastasis to some of the internal viscera, showing the symptoms of edoematous disease, are to be considered as unfavourable. Rheumatism seldom, moving fatal affords few opportunities, for post mortem examinations,

in the thickening of the membranes, adhesions and gelatinous effusions, are the most usual appearances exhibited.

Of the Cure. The principal object to be attended to in the acute form of rheumatism, is, to obviate the general inflammation, <sup>but</sup> and the its effects such as an excitation, is benediction, and when peculiar excitement is considerable, constitutions robust and attended with great heat and pain, the Laxative should <sup>be used</sup> to a considerable extent, or until some decided emproision is introduced on the system. In the chronic states benediction is imperiously demanded, as well to prepare for the administration of other remedies, as to accomplish the above indication, for without such preparatory steps their beneficial effects are not obtained. Although I consider benediction of the greatest importance, in most cases, yet some do occur, in which it should

not be repeated without great circumspection;  
such as are of irritable habits, and such as  
are unaccustomed with much general inflama-  
tion; here, general bleeding from the system  
may probably do great harm.

Purgatives the benefit derived by making a  
salivation from the general circulation, <sup>by purging</sup> in  
the early stage of rheumatism, is no less re-  
markable, than in any other inflammatory aff-  
ection. Rheumatism will, by negligence or  
bad management, sometimes continue for a  
considerable ~~space~~ <sup>of</sup> time, without much  
abatement. The phlogistic deathosis is here  
kept up, while the strength of the system is  
so much reduced, as utterly to forbid in-  
crease of blood. Even of venesection  
be admissible from the degree of excitement  
remaining, it generally does harm. In  
the late purging will prove of great advantage.

The bath.

under similar circumstances, do we obtain ~~these~~  
its beneficial effects. The mobility of the art-  
eries becomes quieted and the excitement diffused over  
the system, which is, under such circumstances,  
dependent on the blood-flow. The saline, purges are  
not. Local administration so as to obtain its  
urgative operations, often proves of great service.  
Purgatives. Laxatives were generally resorted to by the  
ancients, as preliminary to the administration  
of the bath. The use of emetics in this disease does  
not appear to be of much importance, except in  
such cases as are attended with intermittence,  
where the stomach becomes loaded, which latter  
is a very rare occurrence. If any advantage is  
to be derived from vomiting, except under the cir-  
cumstances above mentioned it must be by  
its purgative influence over the circulating  
system, and the relaxation they produce on the

to the skin.

Stupefactions.—These form a very important part in the treatment of inflammation <sup>in the skin</sup> as remedies they have been extolled for centuries and were the only means resorted to in its removal. <sup>Never</sup> it is to be feared should not be employed until much blood & tissue has been procured. It is stated, that when sweating takes place in a highly excited state of the system, it moves it to decrease, but on the contrary, aggravates the symptoms. After having secured arterial action, we may commence with diaphoretics of the milder kind:—Such as the Arabian orals and nitrous preparations we then commence with some of a more stimulating nature. The Dover's powder is a remedy of great efficacy in this degree, and has the undivided confidence of most practitioners, but to procure its simplest effects, strict attention should be paid to

to the state of the system, and never establish it while  
the least excitement whatever remains. Sweating  
once induced, should be continued for twenty  
four hours, if there should be no circumstance  
in which would induce us to discontinue it. In  
conducting the sweating, particular attention to  
the state of the system, should not, by any  
means, be neglected, as the sweating may be  
very properly without being of any service,  
but on the contrary be productive of injury by  
weakening the system and rendering him  
liable to become affected by the slightest exposure.  
The pains in these cases are very ex-  
isting, no doubt keeping up fever and gener-  
ally ~~inflammation~~ <sup>sympathy</sup>. Practitioners differ as to the prop-  
er mode of treatment, but some cold has been recom-  
mended to be applied to the inflamed parts, and by  
others it has been equally ~~disapproved~~ <sup>approved</sup> of. This practice has been  
in this country on the authority of the Russian phy-

[illegible]

sicians, but not with sufficient success to admit  
of repetition. Why the disease, which we have  
seen much cases of inflammation, has not as yet  
been satisfactorily explained. The practice per-  
formed <sup>in such</sup> cases, as are attended with much pain  
and inflammation, and that confined to one  
particular part, is to resort to topical depletion  
by leeches—followed by a succession of blister-  
ings.—Now and then rheumatism attacks parts  
such as the heart, lungs and diaphragm, &  
other, from their great importance to the con-  
ducting of the animal economy, demand  
the most prompt and efficacious treatments.  
Blisters should be employed as near the origin-  
al part affected as possible, this action being  
very slow, we resort to emopisms and every  
measure to hasten their operation.

Diets.—It should be always of the lightest kind,  
consisting chiefly of simple dietetics—such as

to the address  
the the Legation  
on some acc  
out from

strong, barley water, then quark and sometimes  
with the addition of some sugar fruits.

When the dyspepsia subsides, the patient may  
have some animal foods; but of these is too  
hast to form it should not be given.

The convalescence. The use of toning medicines  
sometimes become necessary, the bark alone, or  
combined with some mineral acids, is very  
empirical. The stiffness, aching and debility which  
usually follow the inflammatory state, yield to  
exercise and frictions.

The prophylaxis. It consists in the strict  
avoidance of the cause, and every thing that would  
have a tendency, either generally or locally, to de-  
velop the system. Flannel worn next the skin  
should not be omitted, and persons of a delicate  
habit should wear it through the year during the  
winter.
